Sirona Medical Hiring Team

Staff Frontend Software Engineer

Hello,

The best professional tools feel like they're reading your mind. They anticipate what you need, get out of your way, and let you work as fast as you can think.

That's exactly what drew me to Sirona. You're not building another radiology viewer—you're building RadOS, an operating system that helps radiologists focus on diagnosis and patient care. The complexity lives in the software so it doesn't have to live in their workflow.

I've spent 12+ years building exactly this kind of interface: **complex, data-rich applications that feel simple**. My path has been unusual—customer support team manager → on-screen educator → marketplace operations → system architect at Webflow. That progression means I understand professional tools from every angle: the support tickets that reveal where interfaces fail, the educational content that makes features accessible, and the architecture that makes complex systems performant.

12+ years JavaScript, deep React/TypeScript experience

This is my core stack. I've built production applications with GraphQL, complex state management, and real-time data. The experience is deep, not just broad.

Data visualization and interactive dashboards

I've built analytics dashboards, custom D3.js charts, and complex nested data displays. I understand how to render data clearly and performantly—critical for medical imaging workflows.

Product-minded by experience

I've been the support rep fielding complaints, the educator explaining features, and the architect designing systems. That breadth means I think about user experience first,

implementation second.

Collaboration across functions

At Webflow, I work closely with Product, Design, and Backend to deliver polished experiences. The job description mentions working with designers, product managers, and scientists—that's exactly how I work.

The job description mentions building "trustworthy doctor experiences"—interfaces that are "simple, easy to comprehend, performant and reliable." That's the challenge I care about most. Complex systems should feel effortless. The technology should disappear; only the outcome should remain.

I'm happy to travel to San Francisco quarterly for working sessions. I'd welcome the chance to discuss how my experience building professional-grade applications could contribute to RadOS and Sirona's mission.

Looking forward to the conversation,

Micah Johnson
