Akkio Hiring Team

Full Stack Web Engineer Position

Hello,

Here's the thing about making AI accessible: it's not about the AI. It's about the person trying to get their job done.

That's what drew me to Akkio. You're not building another AI tool for data scientists—you're building the layer that lets marketing professionals actually use their data. I've spent 12+ years doing exactly that: finding where people waste time on complex systems, then building interfaces that make the complexity disappear.

My path at Webflow has been unusual: customer support team manager → on-screen educator → marketplace operations → system architect. That progression means I understand products from every angle—from support tickets that reveal real pain points, to educational content that makes features accessible, to the systems architecture that makes it all work. Now I'm designing the data infrastructure that powers our marketplace, working with Census, Snowflake, Amplitude, and Segment to turn raw data into product decisions.

Full-stack with data infrastructure depth

12+ years of JavaScript/TypeScript. Currently building data pipelines with Census, Snowflake, Amplitude, and Segment. I know how to get data from point A to point B—and more importantly, how to make it useful when it arrives.

Framework fluency

React, Next.js, SvelteKit, Node.js, Vue.js. I've shipped with Vite, understand modern build tooling, and write code that other engineers can maintain. The framework matters less than the patterns.

Product-minded by necessity

I've been the person answering support tickets, the person creating educational content, and the person building the systems. That breadth means I think about how features will be used, not just how they'll be built.

Startup metabolism

I'm building WORKWAY (TypeScript workflow marketplace) and co-founded Half Dozen (live events platform) alongside my day job. I know how to balance tech debt with feature velocity and ship when "perfect" isn't an option.

Akkio's positioning—AI workflows for the campaign lifecycle—resonates with what I've been calling the automation layer: systems that make decisions while you sleep. The interface between human intention and system execution.

I'd welcome the chance to discuss how my experience making complex systems accessible could contribute to Akkio's growth.

Looking forward to the conversation,

Micah Johnson
