Tomo Mortgage
Engineering Team

I'm applying for the Frontend Engineer role at Tomo. Your mission—eliminating greed and complexity in lending—resonates with how I think about software: the best systems disappear into transparent use, leaving only the outcome.

On user empathy: I spent two years in customer support at Webflow, answering 500+ technical questions. I learned that users don't want features—they want to accomplish something without friction. That understanding shaped everything I've built since. When you say you want someone with "empathy for homebuyers," I hear: someone who's felt the frustration of being stuck, and builds to eliminate it.

On the technical stack: I work daily in TypeScript, React, and modern frontend tooling. At Webflow, I've built consumer-facing systems for millions of users, with attention to performance, accessibility, and SEO. I use Tailwind, Vitest, and component-driven development with Storybook-like patterns. The transition to Next.js would be straightforward—I've used it, and the patterns align with my SvelteKit work.

On AI in engineering: This is where I get genuinely excited. I'm actively building AI-native systems—my side project reduced 155 scripts to 13 through systematic LLM integration. I use Claude Code daily for development, understand prompt engineering patterns, and have shipped production agentic workflows. I'm not just "interested in AI tools"—I'm already building with them.

On startup environments: My Webflow career wasn't a straight line. I started in support, built an LMS to solve an onboarding problem, got promoted to team manager, then built a template submission system when Marketplace asked. I left, got brought back as a contractor specifically for that work, then rejoined full-time. The pattern: I find problems, build systems to solve them, and ship.

Tomo's mission is to make mortgages less frustrating. I've spent my career making complex systems feel simple. That alignment is why I'm reaching out.
