Hightouch
Engineering Team

I'm applying for the Software Engineer, AI Agents role at Hightouch. Your description—"product-minded AI engineer" who can "both rapidly prototype and architect production LLM pipelines"—describes exactly how I work.

On product intuition: I spent two years in customer support at Webflow, handling 500+ direct interactions. That experience fundamentally shaped how I think about products—I don't start with "what's technically interesting," I start with "what's the user trying to accomplish, and what's blocking them?" When I see your example workstream about "developing a deep understanding of user workflows to create seamless AI-assisted experiences," that's not abstract to me. It's the lens I naturally use.

On creative LLM applications: I'm currently building WORKWAY, an AI agent platform. I've architected multi-agent systems (sequential, parallel, iterative patterns), implemented tool calling and retrieval patterns, and shipped production agentic workflows. My tracked experiments show systematic exploration of what LLMs can and can't do reliably—47 experiments, 155 scripts reduced to 13. I know how to rapidly prototype to test ideas, and I know when to invest in production architecture.

On data agents: Your example about "production data agents that can make use of a company's data to seamlessly answer analytics questions" matches work I've done. At Webflow, I've built systems that connect user analytics to product decisions. With CREATE SOMETHING, I'm building agents that analyze patterns across integrated services. The data warehouse specifics (Snowflake, Databricks) are new, but the patterns—connecting disparate data sources, making them queryable through natural interfaces—are familiar.

On the interview process: I noticed you don't do programming interviews—you evaluate system design and agentic architecture. That's where I'm strongest. I've spent my career architecting systems end-to-end: I started in support, built an internal LMS to solve an onboarding problem, got promoted to team manager, then built a template submission system

when Marketplace asked. The pattern: I identify problems, design solutions, and ship production systems.

Hightouch is building AI for marketing teams at the intersection of two shifts I care deeply about: agentic AI and data infrastructure. I'd be excited to bring my combination of product thinking and AI engineering to help marketing teams work with their data more effectively.
