Nava Benefits
Engineering Team

I'm applying for the AI Engineer role at Nava. When I saw "some excitement about MCPs" in your job posting, I had to reach out—I have production MCP servers running in my development environment right now.

On AI engineering experience: I'm not just interested in AI tooling—I'm building with it daily. My current project (WORKWAY) uses Claude Code, multi-agent orchestration patterns, and MCP integrations for task coordination, code analysis, and browser automation. I've shipped agentic workflows that reduced 155 scripts to 13 through systematic LLM integration. I understand tool calling, prompt engineering, and how to make foundation models behave reliably in production.

On your tech stack: Direct alignment. React/Vite/Next.js on frontend, Node/Express on backend, TypeScript throughout, PostgreSQL for data, REST and GraphQL APIs. I use Cursor and Claude Code as my primary development environment—the same tools you list. The transition would be immediate.

On cross-functional collaboration: My Webflow career started in customer support—two years translating user frustration into technical solutions. I then moved to the Education team, where I helped launch Webflow University 2.0, making complex concepts accessible to non-technical audiences. Now as System Architect, I work daily with product, design, and backend teams. I know how to communicate with stakeholders who aren't on the technology side.

On building delightful AI solutions: The best AI features disappear into the workflow. Users shouldn't think "I'm using AI"—they should think "this just works." My support background taught me that users want outcomes, not features. I build AI integrations with that lens: what's the user trying to accomplish, and how do we get them there with less friction?

Nava's mission to fix healthcare through better technology resonates with me. Complex systems that frustrate users are exactly what AI can help simplify—if built thoughtfully. I'd love to bring my experience building AI-native applications to help HR teams and employees navigate benefits without the chaos.
