OpenAI

AI Deployment Engineering Team

I'm applying for the AI Deployment Engineer role. Your description—"ensure customers realize tangible business value from their investment in OpenAI's technologies"—describes work I've been preparing for across my entire career: understanding what users actually need, then building and deploying solutions that deliver it.

**On customer engagement and technical consulting:** I spent two years on Webflow's support team, handling 500+ direct customer interactions. I learned what adoption challenges actually look like from the customer's perspective—not the abstract "they need training," but the specific moments where confusion becomes frustration. I then moved to Webflow's Education team, where I helped launch Webflow University 2.0 and created content reaching thousands of users. I know how to communicate with both executive and practitioner audiences because I've done it at scale.

**On GenAI deployment experience:** I'm currently building WORKWAY, a GenAI platform using OpenAI and Anthropic APIs. I've architected agentic workflows, implemented tool calling and RAG patterns, and guided projects from prototype to production. I've tracked 47 experiments documenting what works and what doesn't when deploying GenAI solutions. I understand the gap between "this demo is impressive" and "this runs reliably in production"—and I know how to close it.

**On accelerating customer time-to-value:** When I was in support at Webflow, I built an internal LMS to solve an onboarding problem. That system accelerated how quickly new team members could help customers. The Marketplace team noticed, asked me to build their template submission system. I've repeatedly found ways to identify bottlenecks and build solutions that remove them. That's exactly what AI Deployment Engineering is: finding where customers are stuck and building the path forward.

**On scaling best practices:** Your job posting mentions contributing to documentation and open-source resources. I've done this—Webflow University content, technical documentation,

knowledge base contributions. I understand that the best way to scale impact is to codify what works so others can replicate it.

OpenAI's mission—ensuring AI benefits humanity—requires not just building great models, but helping people actually use them effectively. That's the deployment side of the equation. I'd be excited to help OpenAI customers transform their businesses through GenAI applications that deliver real value.
